Fact Sheet on ICD-10 Coding of Neoplasms

Introduction

The International Statistical Classification of Diseases and Related Health Problems, 10th Revision (ICD-10) is a coding of diseases and signs, symptoms, abnormal findings, complaints, social circumstances and external causes of injury or diseases, as classified by the World Health Organization (WHO).

The purpose of this Fact Sheet is to provide the reader with factual knowledge and insight into the international system of coding of neoplasms (cancers) that is currently in use.

[Picture Credit: ICD-10 Codes]

ICD-10-CM/PCS code sets enhances the quality of data for:

- Tracking public health conditions (complications, anatomical location)
- Improved data for epidemiological research (severity of illness, co-morbidities)
- Measuring outcomes and care provided to patients
- Making clinical decisions
- Identifying fraud and abuse
- Designing payment systems/processing claims

Previous versions of the classification system were not sufficiently robust to serve the health care needs of the future. The content was no longer clinically accurate and had limited data about patients' medical conditions and hospital inpatient procedures. The number of available codes were limited, and the coding structure was too restrictive.

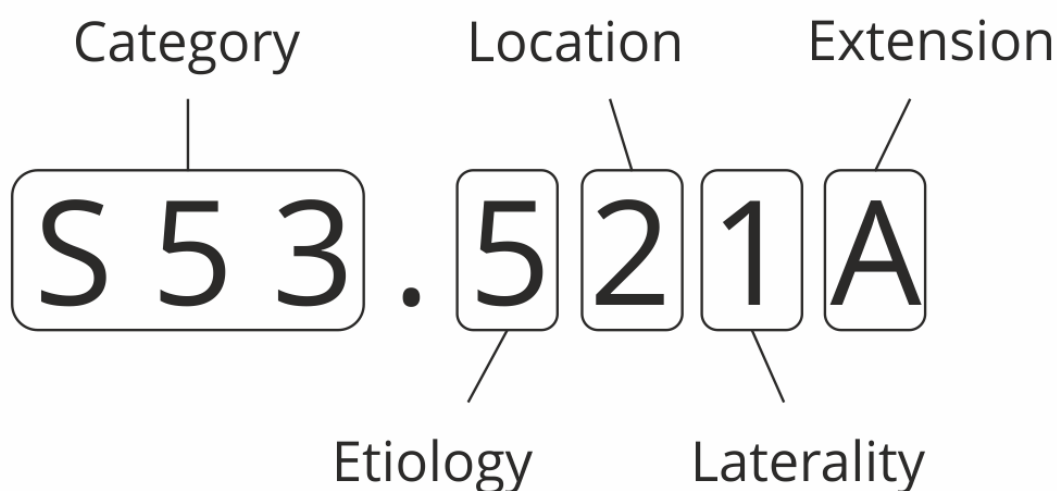

This Fact Sheet only provides the major classification of neoplasms (cancers) – it does not provide the finer detailed analysis which the system makes provision for. The more decimal points that appear in the diagnosis or procedure code, the more detailed the information becomes.
